ABOUT NEVADA GAMING CHIP

Nevada Gaming Chip is the fastest growing chip manufacturer in the world and one of only two clay chip manufacturers for casinos. With history dating back before the Las Vegas Strip, our roots (1937) come from Langworthy Casino Supplies, RT Plastics, and Gambler's General Store. Our casino currency can be found in casinos worldwide. Nevada Gaming Chip has supplied every major U.S. gaming corporation and produced more than \$1 billion worldwide in casino currency.

NEVADA GAMING CHIP • CUSTOM CHIP RACKS

Nevada Gaming Chip's exclusive rack designs are manufactured specifically for our chip molds.

Heavy-duty 39mm and 43mm stacking racks (no lids) custom-molded for our chips—69mm ID width. Also 50mm racks.

- A. 39mm chips: 100-chip capacity
- B. 43mm chips: 100-chip capacity
- C. 50mm chips: 60-chip capacity

NGC CASINO RACKS

STOP THEFT BEFORE IT OCCURS WITH TABLESIDE SECURITY

Nevada Gaming Chip has developed the most secure gaming chip security in the world—overt 3D holographic technology. This currency-level protection is not only impossible to reproduce, but also *brings your security tableside*. Sure, we can do space-age securities like taggants, or antiquated and technologies like UV—you ask, we'll deliver—but their glaring flaw, the necessity of backroom verification, identifies the problem *after* your money is gone. We offer three levels of holographic security—Level I: Holographic Fractals; Level II: Holographic Ghosting; Level III: Holographic Fingerprints—*only* available from Nevada Gaming Chip.

Nevada Gaming Chip's "Secret Sauce"

As a chip shifts to catch light, our "secret sauce" reveals the holography, and more fractals appear or diminish within the live area. To the naked eye the securities are easily visible.

GUIDE TO NEVADA GAMING CHIP'S 3D HOLOGRAPHIC SECURITIES

Our proprietary 3D holographic chip technology is impossible to reproduce by any means known to man *and* your security is brought tableside! Dealers and pit managers can stop theft before it occurs by verifying chips with their naked eye. Our securities are the very best in the world—bar none—and is taking the industry by storm. Our exclusive technology is taking the industry by storm. Here are three tremendous advantages this security brings to your games:

1. You can see the security features with the naked eye—stop theft right at the table! No other security technology offers this essential feature.
2. No camera in the world is able to capture the holographic images we "impress" on the inlays.
3. The most sophisticated printer in the world *cannot* reproduce our holographic images—it is impossible given current printing technology.

NEVADA GAMING CHIP OFFERS THREE LEVELS OF HOLOGRAPHIC 3D SECURITY:

LEVEL I: 3D Holographic Fractals. This security is equivalent or superior as an anti-counterfeiting measure compared to UV securities—appropriate for budget-minded properties seeking a basic but strong security.

LEVEL II: 3D Holographic Fractals + Ghosting. This extraordinary and sophisticated security, is a currency-level anti-counterfeiting system—the strength you would find on sovereign currencies.

LEVEL III: 3D Holographic Fractals + Ghosting + Fingerprints. This is even more powerful for casinos that want air-tight Fort Knox security.

OUR 3D HOLOGRAPHIC SECURITY CHIPS HAVE NEVER BEEN COMPROMISED

3D HOLOGRAPHIC FINGERPRINT SECURITY

3D Holographic Fingerprints are contained within translucent holographic fractals on the surface of live image areas. Your original art is easily viewed below the clear holography, but as a chip is rotated, catching light, “fingerprints” appear within the fractals. This technology is neither printed or created, but rather a “secret sauce” we created that is impossible to reproduce.

What’s even better: The dealer or pit crew can easily see that the chip is legitimate.

The underlying design is not obscured. 3D Holographic is impossible to reproduce yet can be seen by the naked eye giving casinos tableside security.

The same label on a different chip under different lighting conditions.

THE ART OF THE INLAY - WHERE YOUR SECURITY NEEDS TO BE

There are thousands of individuals in every city with the rudimentary skills to paint and counterfeit any manufacturer’s chip. It’s pretty simple, actually. Take an extremely complex job such as the world’s most famous painting, the Mona Lisa. Many experts suggest that the Mona Lisa housed in the Louvre is a fake. Many intricate paintings have been counterfeited, a process requiring enormous skill. It has been done numerous times. But a simple chip? Easy.

That is why we put our securities in the inlays. Our 3D Holographic technologies are impossible to duplicate by any means known to man and the authenticity of the chips can be verified tableside with the naked eye—no equipment is needed. The only way to counterfeit our inlays is to create them. Not a single one of the regular Joes that can counterfeit any company’s chips or the expert counterfeiters that can duplicate the Mona Lisa so perfectly that experts cannot identify an authentic masterpiece from a fake can duplicate our inlays. *Not one.*

Take a manufacturer’s orange chip and color it brown, something hordes of artists in every city can do. We cannot stop that. No one can. However, the grifters who can perfectly color chips *cannot* replicate our labels. They would need very expensive equipment—and there are not many of the sophisticated machines we use out there—and then you would need one of the few specialists who can operate the machine. Okay, you eliminated those counterfeiters. All of them. But what if you found an operator and the machine? *You still can’t do it!* Our currency-level anti-counterfeiting technology has baffled even top security experts. Our inlay securities cannot be duplicated with the best camera made. It is impossible.

That’s why our chips are the most secure anywhere—bar none—due to our ability to secure the inlay against counterfeiting. That is why Nevada Gaming Chip securities are the best in the world. **Nevada Gaming Chip: The art of the inlay.**

3D-ID HOLOGRAPHIC GHOSTING SECURITY

Nevada Gaming Chip’s proprietary and exclusive 3D-ID Ghosting allows casinos to uniquely identify their chips by name or logo. We can size the technology as desired, whether prominent or diminutive, in combinations or in multiples. The technology can be located anywhere on the inlay, or the text can be ghosted in multiple incarnations. However the technology is handled, we “impress” the art on translucent overlays so that it doesn’t obscure the underlying art. To the naked eye, the securities are easily visible as you see below.

3D HOLOGRAPHIC PILLARS OF WISDOM

An additional 3D overt holographic security, “Pillars of Wisdom,” works best within a solid image, as in the example below. Our “secret sauce” creates thin, vertical or horizontal lines in alternating darker and lighter columns to create a stunning image seen by the naked eye and verified for authenticity tableside. It is also impossible to reproduce with any camera known to man.

Pillars of Wisdom

Pillars of Wisdom

The Pillars of Wisdom, like the other 3D holographic securities produced by Nevada Gaming Chip, is visible to the naked eye, stopping theft tableside—before it occurs.

UV SECURITIES

UV
SECURITY

COVERT, OVERT, DOUBLE DRAGON, SPHINX, BLANKET

We offer five UV securities—Overt, Covert, Double Dragon, Sphinx, and Blanket UV—and a combination security of both UV and our proprietary 3D Holographic Technology.

1. **COVERT UV:** This is the standard UV, invisible to the naked eye under normal lighting. When the image is passed under a black light, the hidden UV message appears.
2. **OVERT UV:** Overt, meaning visible to the eye, are bright printed foils that enhance the inlays. When chips are passed under a black light, the overt UV luminesce in bright hues.
3. **DOUBLE DRAGON UV:** Enhanced UV security combines a double layer of Overt UV colors in exclusive patterns, the cardroom's name, or any custom art. Overt UV printing is visible to the naked eye, but luminesces brilliantly under a black light providing dual security.
4. **SPHINX UV:** A double layer of UV securities, the Sphinx combines one of the four colors of the Overt UV with an additional layer of Covert UV for enhanced security protection.
5. **BLANKET UV:** We apply the UV across the entire inlay for full luminesce enhancement of the inlay under a black light.

GOLDEN ELEPHANT

Apply covert or overt UV protection along with our 3D Holographic securities.

RFID
SECURITY

RFID CHIP TECHNOLOGY - YES!

ASK ABOUT SETTING UP YOUR CASINO WITH RFID

Nevada Gaming Chip's gaming currency can be embedded with radio frequency identification for casinos and cardrooms seeking to track and protect chips with this modern security. The RFID chips can also be combined with our 3D holographic technology for the ultimate in high-end casino security.

INJECTION-MOLDED CHIPS VS. CHEAP CERAMIC CHIPS

(Nevada Gaming Chip does not manufacture ceramic chips)

These pages illustrate why the industry is moving away from the ceramic “toilet-bowl” chips with limited lifespans. The examples shown here are actual chips currently in live play. They are a familiar sight to players who have played in games using the T-bowls.

NEVADA GAMING CHIP EXCLUSIVELY MAKES QUALITY INJECTION-MOLDED CLAY CHIPS

PROS & CONS IN A NUTSHELL

Ceramic (Toilet Bowl) Chips

WE DO NOT MAKE THESE CHIPS

Actual “Toilet Bowl” Chip

Pros

- Cheap to buy
- Attractive before use—if you like the look

Conclusion

Short-term value, medium-term disaster

Cons

- Short lifespan
- After live usage:
 - a. Image fades badly
 - b. Chips degrade
 - c. Chips become thinner & thinner & *thinner*
- Not ideal for players who shuffle chips
- **Easy to counterfeit: mages painted on chip**
- **A Branding Nightmare!**

INJECTION-MOLDED CHIPS

Yes—these are the chips we make!

Pros

- Long Lifespan:
 - a. Laminate protects art for 10-20 years
 - b. Chips don't degrade and shrink
- Clay composite and 12.5 gram weight *feel* and look like *real* chips
- They shuffle like real chips
- Last 3-7 times as long as ceramics
- Many times more economical than toilet bowl chips when expensed over their lifetime.
- State-of-the-art security features

Conclusion

For quality, long-term savings and currency-level security, Nevada Gaming Chip offers *exceptional* options.

Cons

- More expensive up front
- Takes longer to manufacture

Injection Molded

BUY INJECTION-MOLDED CLAY CHIPS!

- *Protect your chips!*
- *Protect your image!*
- *Protect your money!*

The old axiom says it best:
Don't be penny wise but pound foolish.

EXAMPLES OF INFERIOR CERAMIC CHIPS

Note: Nevada Gaming Chip does not manufacture these chips

Below are images of ceramic chips from actual live play games in multiple Florida casinos (samples collected October 8, 2018). **Note: These are *not* Nevada Gaming Chip chips.** Newly produced ceramic chips have a nice look to them, but rapid degradation creates faded, muddy images, disappearing logos, and chips that diminish in size. Over time, 21 chips and then 22 chips fit in the rack where 20 did before. Note the dirt on these chips. Again, these are live chips in use *right now*. You must ask yourself two questions:

1. Do you want your image, which is everything you build up for your customers, to fade, be muddy, become indecipherable, and ultimately look...*cheap*?
2. Do you want to replace your rack in a few years—or not replace it and look like below?

**Yes, these are live chips!
NOT ours!**

After heavy usage, this is what you can expect from cheap coeramics, the “toilet bowl” chips—unfortunately, you get what you pay for.

CUSTOM ENGRAVE

CUSTOM CASINO ENGRAVING

We've produced tens of thousands of custom products for casinos and cardrooms across the Western Hemisphere. We manufacture more than 1,000 different engraved items.

Lammers • Table Signs • Wall Signs • Circles • Triangles • Squares • Dealer Buttons • Drop Box Signs • More!!!
